No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                        A Geneseq 101002:*

identified using TSA1, which is an immunogenic conjugate of a phosphate monoester transition state analogue. Antibody 2A10 has a per minute Kcat of 0.011. The antibodies reduce the concentration of cocaine in a subject, and are used particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in vivo concentration that can be achieved).

                                                                                           AAW39818-20 represent the sequences of the light chain complementarity determining regions (CDRs) of the catalytic antibody 6A12, which is able to degrade cocaine. A series of cocaine transition state analogues (TSAs) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl cocaine. The 6A12 antibody was identified using TSA1, which is an immunogenic conjugate of a phosphate monoester transition state analogue. Antibody 6A12 has a per minute Kcat of 0.072. The antibodies reduce the concentration of cocaine in a subject, and are used particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in vivo

A series of cocaine transition state analogues (TSAs) were prepared med to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl cocaine. The 2A10 antibody was
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Variable domain; lambda light chain; catalytic antibody; degradation; cocaine; cocaine transition state analogue; TSA; benzoic acid; phenyl cocaine; immunogenic conjugate; reduction; cocaine; treatment; overdose; addiction.

A series of cocaine transition state analogues (TSAs) were prepared and used to immunise mice for production of hybridomas. Garalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl cocaine. The 12H1 antibody was identified using TSA2, and has a per minute Kcat of 0.16. The antibodies particularly for the treatment of an overdose. They are also used for treatment of an overdose. They are also used for treatming addiction (by reducing the in vivo concentration that can be

This sequence represents complementarity determinating region 2
(CDR L2) of the light chain of murine anti-CD23 (FCERII) monoclonal
antibody Cl1 (see also ANY32262). The invention provides altered
antibodies, such as chimeric or humanised antibodies, which comprise
Sufficient of the amino acid sequences of Cl1 light and heavy chain
CDRs (see ANY32254-59) to render them capable of binding to the CD23
CDRs (see ANY32254-59) to render them capable of binding to the CD23
CDRs (see ANY32254-59) to render them capable of binding to the CD23
CDRs (see LANY32254-59) to render them capable of binding to the CD23
CDRs (see CDRS soluble CD23 formation for treatment of arthritis,
lupus erythematosus, Hashimoto's thyroiditis, multiple sclerosis,
clabetes, uvelis, dermatitis, proriasis, urticaria, nephrotic
syndrome, glomerulonephritis, inflammatory bowel disease, ulcerative
colitis, Crobn's disease, Sjogren's syndrome, allergies, allergic
asthma, intrinsic asthma, acute asthmatic exacerbation, rhinitis,
eczema, graft-versus-host disease, COPD, insulitis, bronchitis
(particularly chronic bronchitis) or diabetes (particularly type 1
for studying interactions between CD23 and various ligands and
collidetes), and B-cell malignancies (claimed). They are also useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Cell receptor specific antibodies useful for treating e.g. arthritis, diabetes, multiple sclerosis and psoriasis -

AAW39815-17 represent the sequences of the light chain complementarity determining regions (CDRs) of the catalytic antibody 389, which is able to degrade cocaine. A series of cocaine transition state analogues (TSAs) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl occaine. The 389 antibody was identified using TSA1, which is an immunogenic conjugate of a phosphate monoester transition state analogue. Antibody 389 has a per minute Kcat of 0.11. The antibodies reduce the concentration of cocaine in a subject, and are used particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in vivo concentration that

                                                                                                                                                                                                                                                                                                                                                                                                                  AAW39975-77 represent the sequences of the light chain complementarity determining regions (CDRs) of a catalytic antibody which is capable of degrading occaine. A series of occaine transition state analogues (TSAs) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl cocaine. These antibodies were found to have CDRs of the present sequence. The antibodies reduce the concentration of cocaine in a subject, and are used particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in vivo concentration that can be achieved).
                                 Light chain CDR2 of a catalytic antibody capable of degrading cocaine.

The invention relates to transforming a population of cells (e.g. plant cells), comprising using a library of two different polynucleotides encoding different immunoslobulin binding protein (198P) polypeptides that specifically bind to a ligand or form one or more disulphide bonds with polypeptides in transformed cells, to generate an IgBP that binds to a ligand, and transformed plant cells are selected, and at least 75% sequence identity to a framework region (FR) of a native IgM, IgG, IgA, IgD, IgE, IgY, kappa or lambda immunoslobulin molecule. The method is useful for preparing an immunoslobulin binding protein carray, preferably heavy chain binding protein (CHBP) array in eukaryotic cells especially plant cells (e.g. Agrobacterium tumefaciens or maize) or other eukaryotic cells (e.g. insect cells or mammalian cells). The CHBP is useful for discovery of e.g. screening assays of IgBPs having desired characteristics. The present sequence is a mammalian in IgBP of immunoslobulin derived peptide that may be incorporated into an IgBP of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

```
The invention relates to a novel two-phase partition system for affinity separation which comprises a phase-forming oligosaccharide polymer to which a polyseccharide binding peptide (PBP) binds, and a phase to which a polyseccharide binding peptide (PBP) binds, and a phase to separation inducing agent. The system may be used for the separation and purification of recombinant proteins from cell cultures. The protein of interest is expressed in the host cell as a fusion protein with a conformation system. The fusion protein partitions into the polysaccharide binding peptide, and the cell lysate or fermentation of interest is expressed in the host cell as a fusion protein with a conjopaccharide bounds to the phase separation system. The fusion protein partitions into the cultose polymer polymer phase, and can then be isolated e.g., via the custom bromide. If the fusion protein has been emplaced such that there is a solution with a low ionic strength, high pl or containing a chaotropic agent, or by the use of chemical cleavage agents such as cransported as the cleaved from the PBP, which remains bound to the oligosaccharide. Proteins that may be purified using the method of the invention include a wide variety of medically and industrially important proteins e.g., interlexin 2, interlexin 3, interlexin 2, interlexin 2, interlexin 2, interlexin 2, interlexin 2, interlexin 2, interlexin 3, interlexi
Two-phase partition affinity separation system useful for separating and purifying proteins comprises a phase-forming oligosaccharide polymer and a phase-separation agent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Ļ

ö

Gaps

The invention relates to an antiHBs monoclonal antibody having the following properties: (A) CDR-3 of H chain variable region; (B) it contains no Epstein Barr virus (EBV); (C) it binds at least one adr type among human HBs antigens. The antiHBs monoclonal antibody is high in antibody titer and has low risk of EBV contamination. It can be used to prevent hepatitis C.

Anti-HBs monoclonal antibody - produced without the risk of Epstein

The present invention describes a method for detecting a retroviral genetic recombinant having agg and pol functions, involving a cell suspected of having a recombinant and propagating the recombinant in the presence of any necessary helper functions. This is useful as it enables the detection of vectors which are able to replicate in the host cell, and allows the production of vectors suitable for gene therapy. The present sequence is a peptide fragment used to demonstrate the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This sequence may be fused to the haemagglutinin 2 (HA2) fragment (amino acids 66-222) of influenza A and the resulting fusion protein used in a vaccine. The purpose of this particular sequence is not given in the specification although such additional peptides to the virus antigen may contain another influenza antigen or other antigen or confer some advantage upon expression of the HA2 peptide. Alternatively the fusion peptide may comprise a sequence which is selectively cleavable by a proteolytic enzyme or upon exposure to a
                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAR46961
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  à
                                                                                                                                                                                                                                                                                                                                                                          ద
                                                                                                                                                                                                          This sequence represents a light chain complementarity determining region (CDR) from a tumour antigen specific antibody.

The invention relates to a method for identifying a binding molecule having selective affinity for a ligand comprising: (a) selectively immobilising a diverse population of binding molecules to a solid support; (b) simultaneously contacting the diverse population immobilised on the solid support with 2 or more Ifgands; and (c) determining at least one binding molecule which selectively binds to one or more of the ligands. The method allows for the rapid and efficient methods for the identification of binding molecules which exhibit selective affinity for one or more ligands of interest. They are used particularly for identifying tumour-specific binding polypeptides which can be used as targeting agents for cancer therapy that minimises impact on non-tumour
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

Tumour antigen, antibody, CDR, complementarity determining region; binding molecule identification; tumour-specific binding polypeptide; cancer therapy; light chain.
                                                                                                                                                                                                                                                                                                                                                         AAW31170-W31181 are peptides derived from various gentoypes of hepatitis C virus. The peptides were used for the production of PCR (polymerase chain reaction) primers used for discrimination between hepatitis C virus (HCV) genotypes. Classification of the genotype of HCV can be achieved precisely and simply according to the international Standardisation of Classification. The primers can be used to distinguish between HCV genotypes la, lb, 2a, 2b, 3a, 3b, 4, 5a, 6a and 6b.
                                                                                                                                                                                                                                                                             Primers used for determining hepatitis C virus genotype - rapid and accurate method of hepatitis C virus genotyping
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        58.1%; Score 18; DB 18; Length 7; 57.1%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 An antigen binding structure is based on the CDRs (given in AAR76078-84) of the heavy and light chains of MAD 55.1 (ECACC 93081901), which recognises the colorectal tumor-associated antigen CAS55.1. It is optionally humanized and in the form F(ab)?, F(ab)', Far, FV, scFv or V-min, and is produced in transgenic animals or plants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

Identifying binding molecules for ligands, particularly tumour antigens - by selectively immobilising a population of binding molecules to a solid support and screening for binding to two or more ligands

Claim 15; Page 57; 80pp; English.

This sequence represents a light chain complementarity determining region (CDR) from a tumour antigen specific antibody.

The invention relates to a method for identifying a binding molecule having selective affinity for a ligand comprising: (a) selectively immobilising a diverse population of binding molecules to a solid immobilising a diverse population of binding molecules to a solid on the solid support with 2 or more ligands; and (c) determining at least one binding molecule which selectively binds to one or more of the ligands. The method allows for the rapid and efficient methods for the identification of binding molecules which exhibit selective affinity for one or more ligands of interest. They are used particularly for identifying tumour-specific binding polypeptides which can be used as transpiring agents for cancer therapy that minimises impact on non-tumour tissues.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 10, Application US/10146305
Patent No. US2002013035A1
GENERAL INFORMATION:
APPLICANT: VURAN CORPORATION
TITLE OF INVENTION: A VARIABLE REGION OF THE MONOCLONAL ANTIBODY AGAINST THE HBV
TITLE OF INVENTION: S-SURFACE ANTIGEN AND A GENE ENCODING THE SAME
FILE REPERENCE: OV1740
CURRENT APPLICATION NUMBER: US/10/146,305
CURRENT PILING DATE: 2002-05-15
PRIOR APPLICATION NUMBER: KR 10-2001-26634
PRIOR PILING DATE: 2001-05-16
NUMBER OF SEQ ID NOS: 14
SOFTWARE: KOPATENTI I.71
                                                                                                                                                                                                                                                                                                                                                             ö

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

ATP-binding protein p46 - dog (fragment)

Cispecies: Canis lugus familiaris (dog)

Cispecies: Canis lugus familiaris (dog)

Ciscession: B49712

Ciscession: B49712

Ciscession: B49712

Ciscession: A10: Ho, S.; Rohde, M.F.; Bush, K.T.; Sherman, M.Y.

J. Biol. Chem. 269, 1744-1749, 1994

A;Title: A set of endoplasmic reticulum proteins possessing properties of molecular chap A;Reference number: A49712; MUID:94124514; PMID:8294423

A;Status: preliminary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Rischoofs, L.; Holman, G.M.; Hayes, T.K.; Nachman, R.J.; Kochansky, J.P.; De Loof, A. determining regions (CDRs) of the catalytic antibody 2A10, which is able to degrade cocaine. A series of cocaine transition state analogues (TSAs) were prepared and used to immunise mice for production of release 3H-benzola catalytic antibodies were identified by their capacity to release 3H-benzola caid from 3H-phenyl cocaine. The 2A10 antibody was identified using TSA1, which is an immunogenic conjugate of a phosphate monoester transition state analogue. Antibody 2A10 has a per minute Kcat of 0.011. The antibodies reduce the concentration of cocaine in a subject, and are used particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in vivo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAW39815-17 represent the sequences of the light chain complementarity determining regions (CDRs) of the catalytic antibody 3B9, which is able to degrade cocaine. A series of cocaine translation state analogues (TSMs) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl cocaine. The 3B9 antibody was
                                                                                   AAW39821-23 represent the sequences of the light chain complementarity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Variable domain, lambda light chain, catalytic antibody; degradation, cocaine, cocaine transition state analogue; TSA; benzoic acid, phenyl cocaine; immunogenic conjugate; reduction; cocaine; treatment;

Tie2 is a single-transmembrane, tyrosine kinase receptor ('Tie' stands for tyrosine kinase receptor with immunoglobulin and endothelial growth factor (EGF) homology domain(8)). Anti-Tie2 antibodies may be administered to enhance angiogenesis in mammals antibodies may be administered to enhance angiogenesis in mammals or other vascular disease, myocardial infarction or cerebral stroke or other vascular diseases such as diabetes. It may also be used to enhance endothelial call survival and to promote haematopoietic or megakaryocyte cell proliferation (claimed).
 identified using TSA1, which is an immunogenic conjugate of a phosphate monoester transition state analogue. Antibody 3B9 has a per minute Kcat of 0.11. The antibodies reduce the concentration of cocaine in a gubject, and are used particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in vivo concentration that can be achieved).

The antibodies neutralise CKDR activation. The immunoglobulin may be a multivalent single chain antibody, a diabody, a triabody, a diabody, a chimarised antibody a diabody, a triabody, a humanised antibody or a chimerised antibody, a diabody, a triabody in molecules bind specifically to an extracellular domain of the KDR receptor with the same affinity as VEGF. Overexpression of VEGF has been implicated in a number of human tumour cell lines including glioblastoma multiforme, hemangioblastoma, central nervous system neoplasms and ALDS associated Karposi's sarcoma. The antibodies therefore have applications in treating these conditions. This sequence encodes a immunoglobulins of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Vascular endothelial growth factor receptor; VEGFR; antagonist; tumour; cytostatic; light chain hypervariable region; VL; myelocytic leukaemia; lymphCcytic; erythrocytic; monocytic; multiple myeloma; lymphoid cell; Hodgkin's disease; complementarity determining region-3; CDR-3; mouse.
                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel immunoglobulin molecules binding kinase insert domain-containing receptor with the same affinity as vascular endothelial growth factor, used to reduce tumour growth
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Humanised antibody murine light chain hypervariable region (VL) CDR3.

                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a method for inhibiting the growth of non-solid tumour cells that are stimulated by a ligand of vascular endothelial growth factor receptor (VEGFR) in mammals by particularly humans. The method involves treating the mammals with humanised VEGFR monoclonal antibodies (antagonists). Humanised monoclonal antibody comprises humanised mouse wariable region joined to human constant region, where the humanised mouse variable region contains mouse complementarity determining region (CDR) grafted into human variable region. The method is useful for treating leukaemias such as acute or chronic myelocytic leukaemia, acute
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         or chronic lymphocytic leukaemia, erythrocytic or monocytic leukaemia, multiple myelomas and lymphoid cells, particularly those related to non-Hodgkin's and Hodgkin's disease. The present sequence is humanised antibody murine light chain hypervariable region (VL) CDR-3 used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence is that of complementarity determining region of 3 of the light chain variable region (see also AAB82702) of IMC-1C11, a mouse-human chimeric antibody that has vascular endothelial growth factor (VGEF) antagonist activity. The antibody, or a fragment of it, can be used as an anti-anglogenic molecule, together with a chemotherapeutic acid, for the treatment of an angiogenic dependent condition in amamal, especially a human. The invention relates generally to a method of treating or controlling an angiogenic dependent condition by administering an anti-angiogenic molecule and a chemotherapeutic agent, to produce a controlling an angiogenic dependent condition while minimising or preventing significant toxicity of the chemotherapeutic agent. The anti-angiogenic molecule inhibits or blocks the action of a vascular endothelium survival factor such as VEGF or its receptor, and is especially IMC-1C11. Conditions that can be treated include a neoplasm, a colladen-vascular disease or an autoimmune disease, especially a solid tumour, including breast carcinoma, lung carcinoma, prostate carcinoma, coun carcinoma, prostate carcinoma, coun carcinoma, prostate carcinoma, coun carcinoma, prostate carcinoma, covarian carcinoma, prostate carcinoma, coun carcinoma, coun carcinoma, encublastoma multiforme or melanoma (all claimed).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       of the light chain variable region of murine monoclonal antibody 2C4. This antibody binds to human sialoadhesin factor-2 (SAF-2). The antibody binds to human sialoadhesin factor-2 (SAF-2). The antibody is useful for treating or preventing allergic rhinitis, allergies, asthma, anemia, eczema or diseases such as lymphoma, leukemia or systemic mastocytosis in a mammal. It is also useful for detecting the presence of a cell, especially ecsinophil in a sample, by detecting binding of the antibody to SAF-2. The antibody can be coupled to toxins, antipooliferative drugs or radiomuclides to kill cells in areas of excessive SAF-2 expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Complementarity determining region, CDR, CDRL3, antigen, cytostatic, anglogenesis inhibitor; vascular endothelial growth factor receptor; VBGF; tumour, leuksemia, antibody; cell proliferation inhibitor; antibody light chain variable domain.

The invention describes an antigen-binding protein (1) comprising a complex of two polypeptides (P1) and two second polypeptides (P2) which are stably associated in an immunoglobulin like complex. Pl has an antigen-binding site located to the N terminus of immunoglobulin (1g) (1ght chain constant domain (CL domain), and P2 has an antigen-binding site located to the N terminus of the CH1 domain. (I) is useful for: site located to the N terminus of the CH1 domain. (I) is useful for: neutralising the activation of a vascular endothelial growth factor (VEGF) receptor; reducing tumour growth; inhibiting anglogenesis; creducing endothelial cell proliferation; inhibiting anglogenesis; creducing endothelial cell proliferation; inhibiting wEGF induced migration of human leukaemia cells; blocking interaction of a protein and its ligand; promoting interactions between immune cells and target cells; cand in vivo and in vitro for investigative, diagnostic or treatment cubstantially all of the antigen-binding proteins production so that substantially all of the antigen-binding proteins production on the cantibody and which provide other antibody functions can be present. There the FC region (e.g., CH2 and CH3 for an IGG molecule) of a natural complementarity determining region L3 (CDRL3) incorporated into an extraction described in the method of the invention.
                                                                                                                                                    New bispecific immunoglobulin-like antigen-binding protein for reducing tumour growth and for inhibiting angiogenesis, comprises a complex of two polypeptides and two second polypeptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Immunoglobulin light chain; hypervariable region; PAF; CDR; antibody; platelet activating factor receptor; murine; chimeric; anti-PAF; complementarity determining region.

A series of cocaine transition state analogues (TSAs) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl cocaine. The 6A12 antibody was identified using TSA1, which is an immunogenic conjugate of a phosphate monoester transition state analogue. Antibody 6A12 has a per minute Kcat of 0.072. The antibodies reduce the concentration of cocaine in a
                                                                                                                                                                                                         This sequence represents the complementarity determining region (CDR) 3 of the light chain hypervariable region of an antibody recognising the platelet activating factor (PAF) receptor. The variable region of mouse anti-PAF receptor monoclonal antibody is useful for the preparation of chimeric antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Variable domain; lambda light chain; catalytic antibody; degradation; cocaine; cocaine transition state analogue; TSA; benzoic acid; phenyl cocaine; immunogenic conjugate; reduction; cocaine; treatment;

subject, and are used particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in vivo concentration that can be achieved).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAW39824-26 represent the sequences of the light chain complementarity determining regions (CDRs) of the catalytic antibody 12H1, which is able to degrade cocaine. A series of cocaine transition state analogues (TSAs) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl cocaine. The 12H1 antibody was identified using TSA2, and has a per minute Kcat of 0.16. The antibodies reduce the concentration of cocaine in a subject, and are used particularly for the treatment of an overdose. They are also used for treatment of the in vivo concentration that can be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Variable domain, lambda light chain, catalytic antibody, degradation, cocaine, cocaine transition state analogue, TSA, benzoic acid, phenyl cocaine, immunogenic conjugate, reduction, cocaine, treatment,

A novel composition has been developed which comprises an immunoglobulin (Ig) having an affinity constant (Ka) of at least 2 multiply (100000000 M-1 for binding to a predetermined human antigen. The present sequence represents a human light chain CDR3 region peptide which forms part of an immunoglobulin comprising a VkL15 segment, a Jk2 segment, and the present light chain CDR3 region. The articD4 antibodies may be used in therapeutic and diagnostic applications, especially for the treatment of human diseases. These autoinmune reactions, inflammatory response and transplant rejection. Transgenic animals are capable of producing heterologous antibodies of multiple isotypes by undergoing isotype switching. These animals of multiple isotypes by undergoing isotype switching. These animals contraction and can switch to encode apply roduce one or more subsequent contraction and can switch to encode apply roduce one or more subsequent contractions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

Patent No. US20020168360A1

GENERAL INPORMATION:

APPLICANT: DINGIVAN, CHRISTINE A.

TITLE OF INVENTION:

COMBINATION WITH OTHER PROPHYLACTIC OR THERAPEUTIC AGENTS

TITLE OF INVENTION:

CURRENT APPLICATION NUMBER: US 10/091,236

CURRENT APPLICATION NUMBER: US 60/273,098

PRIOR PILING DATE: 2001-03-02

PRIOR FILING DATE: 2001-03-02

PRIOR FILING DATE: 2001-03-02

PRIOR FILING DATE: 2001-03-11

NUMBER OF SEQ ID NOS: 17

SEQ ID NO 16

LENGTH: 9

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 19, Application US/09808037

Patent No. US2002052311A1

GENERAL INFORMATION:

APPLICANT: SOLOWON, Beka

APPLICANT: HANAN, Eilat

TITLE OF INVENTION: METHODS AND COMPOSITIONS FOR THE TREATMENT AND/OR DIAGNOSIS OF

TITLE OF INVENTION: NEUROLOGICAL DISEASES AND DISORDERS

TITLE OF INVENTION: NEUROLOGICAL DISEASES AND DISORDERS

CURRENT APPLICATION NUMBER: US/09/808,037

CURRENT PILING DATE: 2001-03-15

PRIOR PELLING DATE: 2000-07-31

PRIOR FILING DATE: 2000-07-31

PRIOR PELLING DATE: 2000-07-31
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
